

Microsoft 365 has become a best-in-class solution for enterprises. However, **management is limited** to the Microsoft portals and scripting. The Simeon platform delivers **automation-based infrastructure management** using configuration as code and provides control, consistency, transparency, and traceability to the Microsoft 365 ecosystem.

- ✓ Easily create **non-production** environments and promote changes into production to implement end-to-end **lifecycle management**
- ✓ Achieve **transparency**, consistency, and auditability of the state of your environment
- ✓ Apply **version control**, track changes, and restore previous configurations
- ✓ Rapidly **deploy Intune**, Azure AD, and Office 365 from industry-standard best practices
- ✓ Empower non-developers to manage configuration as code with our **friendly user interface**

Promote changes between **non-production** and **production** environments.  
**Review and approve** configuration changes before promoting to production.  
Sync multiple environments with baseline configurations to **ensure consistency**.

Configuration  
Orchestration

Instantly **document** and **compare** an environment to best practice configurations.  
Get **notified** of configurations changes.  
Search across all configurations **centrally**.

Monitoring and  
Reporting

Configurations are **stored in code** and synced with your environments.  
**Restore** to a point in time when mistakes occur.  
View **historical** changes to environments.

Version Control

Easily **create** Intune application packages with our **user-friendly module**.  
**Update** and redeploy new application versions.  
Deploy Intune application packages to **multiple environments** in bulk.

Application  
Packaging

### Automation For Maintaining a Modern Digital Workplace

One of Simeon's clients, an investment company, was using SCCM and multiple third-party endpoint management solutions to image and configure 850 desktops. The CTO recognized that Microsoft 365's **Intune** and **Azure AD** had matured to the point of parity with the existing fragmented, more expensive solutions. He tasked his engineering team with implementing a **Modern Digital Workplace** using **Microsoft 365** in concert with an **upgrade** from Windows 7 to 10.

The team used Simeon to quickly deploy a **non-production environment** matching their production configuration to prototype and develop their solution. By leveraging Simeon's best practices baseline for deploying Intune, the team was able to expedite the build of their solution. As the solution became ready to deploy, the team leveraged Simeon's **promotion** and approval capabilities to **migrate** their new configurations to production. When defects were introduced, the team used Simeon to easily identify changes to the environment and roll them back.

In the midst of COVID-19, the team was able to implement a **zero-touch** deployment of more than 500 Windows 10 devices, all shipped from the manufacturer directly to end-users. As compared to previous deployments, which required 4-6 hours per device of dedicated helpdesk and IT operations support, this deployment methodology had **no support overhead** and was entirely self-service. Subsequently, the team's allocation required to support the endpoint management ecosystem **dropped from 75% to less than 10%**. Additionally, by unifying on the Microsoft 365 stack, the firm was able to reduce licensing costs by **\$400K** per year.

### What Our Customers Say About Us

“Simeon Cloud is a critical component of our Modern Digital Workplace and endpoint management programs. The Simeon platform enables essential governance for our Microsoft 365 environment. Since implementing Simeon, our team has reduced the time spent managing endpoint configurations and building Intune application packages by an order of magnitude. The automation we achieved and efficiency we have gained has enabled us to reallocate a team of engineers to focus on delivering new value rather than maintaining our M365 infrastructure.”

- Eric Levin, CTO
